Profile

I independently design and build web applications and business integrations, from requirements and architecture through implementation, testing and deployment. My work includes legal document workflows, bidirectional platform synchronization and AI-assisted operational tools. I focus on reliable state transitions, data identity, recoverable failures and interfaces that let people control complex processes.

Core skills

Web: TypeScript, JavaScript, Node.js, React, Next.js, Express, Fastify.
Integrations: REST APIs, webhooks, OAuth/PKCE, MCP, Microsoft Graph, OneDrive.
State and delivery: PostgreSQL, SQLite, MongoDB, Supabase, AWS SQS/DynamoDB/ECS, Terraform, Docker.
Workflow engineering: workers, queues, idempotency, reconciliation, versioned state, Playwright, Office.js and PDF processing.

Experience

YOUR R&D | CRM and Automation Developer
November 2025 - Present

- Develop business integrations and operational tools using APIs, webhooks, background processing, GoHighLevel and custom code.
- Own implementation across workflow logic, admin interfaces, validation, automated checks, deployment tooling and technical documentation.

FunnelJet | Frontend and Full Stack Developer
May 2025 - Present

- Build web applications, websites and funnels using JavaScript, React/Next.js, WordPress and GoHighLevel.
- Implement forms, CRM connections, e-commerce behavior and external service integrations; deliver and maintain features from requirements.

Kropyvnytskyi City Council, Department of IT | IT Engineer
February 2025 - May 2025

- Supported workstations, software and internal information systems; resolved user issues and contributed to internal automation and documentation.

Earlier freelance work | React / Next.js Frontend Development

- Developed frontend functionality for a waiver-management product, including role-based dashboards, forms and payment-related interfaces.

Education and languages

Kherson National Technical University - BSc Software Engineering, specialty 121.
Fourth year; expected graduation 2027.
Languages: Ukrainian - native. English - B1-B2, self-assessed.

Selected engineering work

Artem Serdiuk | Independent end-to-end development

Legal workflow platform

Designed and implemented an admin application and persistent worker system for email/PDF intake, structured drafts, review and external case preparation.

- Preserved manual field edits during concurrent extraction; pinned form versions and preparation snapshots; implemented restart recovery and reconciliation for uncertain remote saves.
- Built Microsoft Graph/OneDrive integrations, Playwright preparation with saved-bundle verification, and an Office.js Excel add-in generating validated interactive PDFs through an isolated Python worker.

Stack: TypeScript, Node.js, SQLite/WAL, custom HTML/CSS/JS UI, Microsoft Graph, Playwright, Office.js, Python.
Project repository

PatientNow and GoHighLevel integration

Independently built a bidirectional integration backend for contacts, appointments, provider calendars, blocked time and purchase history.

- Designed ordered webhook processing with SQS FIFO, DynamoDB receipts, identity matching, stale-update handling, echo suppression and missed-change reconciliation.
- Implemented cancellation tombstones, timezone normalization and refund-aware sales mapping; authored Terraform definitions for separate API and worker services.

Stack: TypeScript, Fastify, AWS SQS, DynamoDB, EFS, ECS/Fargate, Terraform.
Architecture case study

MCP and AI workflow platform

Designed and built a private operator application connecting authenticated MCP services, PostgreSQL, n8n and source-linked AI draft preparation.

- Implemented OAuth/PKCE, coalesced token refresh, encrypted per-connection storage, transaction-protected state, versioned workflows and durable preparation runs.
- Validated generated output against server-owned evidence, protected manual work from stale responses and modeled uncertain provider outcomes explicitly.

Stack: JavaScript, Node.js, Express, PostgreSQL, OAuth, MCP, n8n.

React product work

CRM-KP: React/TypeScript and Express/MongoDB CRM with JWT authentication, user-scoped clients/deals, Slack notifications and email workflows.
Wishlist: React/TypeScript and Supabase application with groups, reservations, contribution tracking and realtime chat.
